Need A Technology Partner for Patient-Centered Research and Intervention?

About Ringful Health

At Ringful Health, we help clinicians involve patients & families so they can become part of the care team. We provide a suite of patient-centered engagement and decision support systems throughout the entire care cycle, from prevention, screening, hospital admission, in-hospital stay, discharge, to post-discharge follow up.

Our solutions engage patients via multiple consumer communication channels including text messaging, email, voice calls, and video chatting. The data captured from patients are analyzed and propagated to EHR systems. The analytic summary results and action items are shared with patients and clinicians.

Our technology platform disseminates evidence-based content and guidelines directly to patients, enabling better decisions at the point of care and improving communication. Our solutions are designed to work with existing healthcare medical records, workflows, and hospital teamwork structures without adding undue burdens to clinicians.

Collaboration Opportunity

Ringful Health is interested in research that builds the evidence base for patient-centered healthcare solutions and translates that evidence into practice. We established collaborative ties with several leading health science and academic institutions, and are looking to expand our research base. Our overall goal is to advance proactive patient engagement and process management can improve patient health.

In particular, we are interested in validating interventions that can reduce hospital re-admission rates in a cost-effective manner. Our solution includes proactive patient engagement, and identification of high risk patients based on the real time engagement data.

If you are an academic or hospital-based researcher interested in piloting technology-enabled solutions that allows patients and families to participate fully in the care process, contact Ringful Health at info@ringful.com today!

Ringful Health Technology and Research Offerings:

Multi-modal mobile communication solutions to engage patients

Knowledge base for evidence-based patient questionnaires, decision rules and content

Automated workflow and rules engines to manage personalized patient interactions

Big Data analytics engine for real time behavior feedback

Hospital and clinic EHR and case management integration

Experienced team with hospital nursing deployment and quality measurement
